HOKUYO AUTOMATIC CO.,LTD

1. Introduction

This document describes the specification of the communication protocol and control commands related to the UST Series LA type sensor. This specification is partly compliant with the Sensor Communication Interface Protocol (SCIP). Due to the nature of the sensor, some limitations are introduced to SCIP. For more information, please refer to the separate C-42-03320B¹ or C-42-03886². From now onward to distinguish this communication specification from SCIP, it will be referred as "SCIP-LA".

2. Communication interface

This sensor uses one of the following communication interfaces.

• USB2.0

Transfer speed is full speed. Device class is compatible with Communication Device Class (CDC). It is recognized as a serial port (virtual COM port) from a host side. Access to the device from the application should be done only when the host-device configuration is complete and host recognizes the device. (When using USB connection, port should be opened only after the OS assigns the number to the device.)

• Ethernet 100BASE-T

TCP/IP is used for communication. The factory default for the network address settings are listed below.

IP address	:	192.168.0.10
Subnet mask	:	255.255.255.0
Default gateway	:	192.168.0.1
Port number	:	10940(Fixed)

• RS-422

Serial communication is performed using one-to-one communication basis. Communication setting is as follows (Parity: None, Data bit: 8, Stop bit: 1, Flow control: None.) Please refer to SS command for more information related to supported Bit Rate and Bit Rate switching.

Please refer to the product specification for more information related to the communication.

3. Communication sequence

A basic communication is described as the host sends a request message to the sensor, then the sensor reply with a response message to the host. There are two communication patterns: One response per request and multiple responses per request. The first is called "Handshake" and the second is called "Continuous".

¹ http://www.hokuyo-aut.jp/02sensor/07scanner/download/products/utm-30lx/

² http://www.hokuyo-aut.jp/02sensor/07scanner/download/products/utm-30lx-ew/

4. Communication format

All characters used for communication are ASCII code in addition to CR, LF.

(HOST→SE		1	1		
Command	Parameter	String	Termination	char (LF or CR or CR+LF)	
Command Parameter	: De	pending on c		ommand will be explained later. meter may be required. It will be ex	plained in

[GD Command]

The latest distance data is returned when this command is received. Before using this command, make sure the laser is activated for all steps and the measurement is started using "BM" command. However, in SCIP-LA, using this command without "BM" command will result in returning valid measurement for steps defined in the current area. Remaining steps would have error code. Please refer to the below table for distance error code.

current area.	Kemaning s	Tah		or Codes	ter to the belo	Jw table I	of distance ento	I code.
		Error code		Error deta	ils			
		0xFFFF		Object out	of range			
		0xFFFE		Object is t	oo near			
		0xFFFD		Object has	low inten	sity		
		0xFFFC		No object	in the rang	e		
		0		Not measu	rable steps			
	Ľ						Ĩ	
(HOST	→SENSOF	<u>t)</u>						_
"GD"	Start step	End step	Clu	ster count	String	Termi	nation char	
Example) Us	:4 digits t :2 digits Set a su nation char:	-	r repre r repres educe mmuni mmuni	senting the end senting the clu the load during cation Format	d step of dista ster count ste g communicat Section. ce data of all	nce acqu p. Default tion. steps fron	isition of the are t value is "00". n step 0 to step	ea.
Status	SUM	LF						
Time sta	amp SU	UM LF						
Data	50141	LI						
Data	SUM	LF LF]					
Status: Typic	cally "00" is a	returned.						
	-	s an internal cou characters enco				-	-	•
Data · 3 char	acter encoded	l distance data N	When t	he total data ex	reeds 61 byt	es IEma	ork and SUM ar	e inserted

Data: 3 character encoded distance data. When the total data exceeds 64 bytes, LF mark and SUM are inserted after each block of 64 bytes.

	UST Series LA Type
ΤΙΤΙΕ	Communication protocol

In SCIP, a character encoding method is used in order to compress the data sent to the host. It is defined as follows. Numbers are divided in groups of 6 bits. 30h value is added to each group. The result 6 bits encoding is ordered from high-order to low-order bits. After encoding, if the number of generated characters is two, then it is called "two characters encoding". If three characters, then it is called "three characters encoding" and if four characters, then it is called as "four characters encoding".

Example) Decoding of 3 character encoded distance data having "1Dh" as encoded value.

'1' (31h) 'D' (44h) 'h' (68h) ↓ Subtract 30h 1h 14h 38h ↓ Merge 000001 010100 111000 ↓ Decimal Value 5432mm

[MD Command]

The distance data obtained within the specified condition is returned when this MD command is received.

(HOST \rightarrow SENSOR)

"MD"	Start step	End step	Cluster	Scan	No. of	String	Termination
MD	Start step	End step	count	Interval	scans	String	char

Start step/End step/Cluster count: Refer to the GD command section.

Scan Interval :1 digit decimal number representing the number of scan to skip. Default value is '0'. Set a suitable value to reduce the load during communication.

Number of scans :2 digit decimal number representing the requested number of scan data. Use "00" to obtain continuous unlimited scans.

Example) Use command "MD000001000000000" to obtain unlimited distance data of all steps from step 0 to step 100 without skipping scans

• Initial response after the command is received

(SENSOR→HOST)

Status SUM LF LF

Status: Typically "00" is returned.

• Continuous response of distance data

(SENSOR→HOST)

"MD"	Start step	End step	Cluster	Scan interval	Remaining	LF
	1	1	count		scan	
r						
Status	SUM	LF				
Time st	tamp S	SUM LE	7			
Data	SUM	LF				
Data	SUM	LF LF	1			
L	•	I				
Status: Tvp	ically "99" is	returned.				
J1	j i i i					
Time stamp	/Data: Refer	to the GD cor	mmand sectio	n.		
r r						
Measureme	nt error: Refe	r to the GD c	command sect	ion.		

[GE Command]

GE command works the same way as GD command. The difference with GD command is that GE command returns not only distance data but also intensity.

(HOST→SENSOR)

"GE" St	tart step End step	Cluster count	String	Termination char
---------	--------------------	---------------	--------	------------------

Start step/End step/Cluster count: Refer to the GD command section.

(SENSOR→HOST)

"GE" Start step End step Cluster count String	
	LF
Status SUM LF	
Time stamp SUM LF	
Data SUM LF	
Data SUM LF LF	

Data: It is consists of distance data (Refer to the GD Command section) and intensity. All data are 3 characters encoded.

Intensity is the reflected strength of the laser. The reflected laser intensity value is represented by 18-bit data. It is a relative number without a unit. Intensity may differ depending upon the distance, material and detection angle of the object. Therefore, users should check the detection capability verification test.

[ME Command]

ME command works the same way as MD command. The difference is similar to GE command as ME command returns also intensity.

(HOST→SENSOR)

"МЕ"	Start stap	End step	Cluster	Scan	Number	String	Termination
IVI L	Start step	End step	count	interval	of scans	String	char

Start step/End step/Cluster count: Refer to the GD command section. Scan interval/Number of scans: Refer to the GE command section.

Initial response after the command is received.

(SENSOR→HOST)

"ME"	Start step	End step	Cluster count	Scan interval	Number of scans	String	LF

Status: Typically "00" is returned.

Continuous response of distance data and intensity

[II Command]

This command is used to obtain status information of the sensor. Also, error number is returned during error state.

(HOST	ſ→SENSOR				
"II"	String	Terminati	on char		
(SENS	OR→HOST				
"II"	String	LF			
Status	SUM	LF			
Sensor	model	SUM	LF		
Status	of the laser	; S U	M LI	F	
Scanni	ng speed	; S U	M I	LF	
Measur	ement mode	; SUM	LF	7	
Speed	of serial con	munication	;	SUM	LF
Time s	tamp	; SUM	LF		
Status	of sensor	; SUM	LF	LF	

Status: Typically "00" is returned.

During the error state of the sensor, error code is displayed after "STAT" in such a case, consider reporting it to our company including the contents of "II", "VV" command response.

Example) "Ⅱ�"

[RB Command]

This command is used to reboot the sensor. However, it requires a special procedure to use it. Within 1 second, 2 request messages should be sent and their corresponding response message should be received. Otherwise, the sensor continues to be in the same state and does not reboot. However, in SCIP-LA, this RB command is only valid when sensor stops due to error.

"RB"	String	Ter	mination char
SENSO)R→HOST)		
"RB"	String	LF	

Status: Typically, the 1^{st} time "01" is returned. The 2^{nd} time "00" is returned.
