

Thank you for purchasing the color vision sensor series Edge Identification Sensor (CVS3).  
 Before operating the product, read this manual thoroughly for optimum use.  
 Keep this manual handy for future reference.  
 This product cannot be used as safety device for protection of human body.

**1 Before Operation**

**What is Edge Identification Sensor?**

The image sensor detects the edge (contour) of the color of captured image and stores it as the reference image. The sensor compares the reference image and the object image to find the **missing edge** (the contour may not be perfect) and **stain** (if unnecessary pixels are occupied by edge data). The object is judged OK when its missing/stain pixels are less than the threshold setting. The sensor identifies letters, shapes, directions, stains, and missing edges.

**Parts Identification**

**External Dimensions**

**Connection of Power Supply and Input/Output Wire**

The line colors and signal allocations of power supply and input/output wire are as follows.

No.	Color	Signal
1	Brown	V2 to 24V DC
2	Blue	TV
3	Orange/Black	Bank selection 0 input
4	Yellow/Black	Bank selection 1 input
5	Pink	Bank selection 2 input
6	Purple	Bank selection 3 / Synchronous input
7	Black	OK output
8	Red/Black	NG output / Lighting control output

**Specifications**

Model	CVS3-N20 CVS3-P20	CVS3-N21 CVS3-P21
Detection angle	20	
Capture range	90 to 150mm	31 to 38mm
Capture area	40 x 40mm to 65 x 65mm (± 10%)	17 x 20mm (± 10%)
Light source	White LED 12 pcs	
Supply Voltage	12 to 24V DC ± 10%	
Power consumption	Max. 140mA/24V DC	
Resolution	16 × 16 to 208 × 236	
Lamp duration	Approx. 50000 hrs (in normal temperature and humidity. Brightness level down by 1/3 of the initial level)	
Response time	48ms (Factory setting), 2.5ms (Min), 518ms (Max)	
Output signal	NPN/PNP open collector output 2 points max. 100mA. Residual voltage 1.0V or less	
Input	Bank selection/Synchronous/External teaching select 4 points	
Operating temperature	0 to 40	
Ambient humidity	35 to 85%/RH	
Storage temperature/humidity	-20 to 70 / 35 to 95%/RH	
Vibration/shock resistance	10 to 55Hz Amplitude 1.5mm, 500m/s <sup>2</sup> (10 times)	
Material	ABS / Acryl / Polycarbonate	
Protection structure	IP67	
Weight	Approx. 180 g	

**Setup Procedure**

You can complete the setup of CVS3 series simply by following the menus in order.  
**SETUP PARAMTR (page 7)**  
 Select the parameters to display the specified contour (edge). If regular reflection of light obscures the normal detection, use the external diffused lighting.  
**TEACHING menu (page 9)**  
 Store the reference image as well as the capture range and judgment range.  
**OPTION PARAMTR (page 13)**  
 Adjust the parameters for stable detection of conforming/nonconforming products. Select the action for positional change of object, the settings of response time and input/output signals.  
 After learning the basic operation in the chapter 2, select the settings in the steps to

**2 Descriptions of LCD display**

**Main menu**  
 Displays the current screen mode (Page 8)

**Captured image**  
 Displays the image captured by the camera.

**Menu**  
 Indicates the setting and editing menus.

**Number of pixels of missing edge/stain**  
 Indicates the numbers of pixels of missing contour (yellow) and of stain (scratch) (red). Upper is threshold level (white).

**Stability of threshold value**  
 Displays the threshold margin of the judged edge in arrow UP/DOWN. Reduce the edge threshold value (THRESHLD) if it is displayed in arrow DOWN, or increase the value if in arrow UP.

**Screen display mode**  
 Indicates the current screen mode (Page 8)

**Judgment result**  
 Displays the result as OK or NG.

**Bank number / Response time**  
 Indicates the selected bank number (0 to 14).  
 In the settings screen, indicates the time to output signals after image capture in unit of 0.1 ms.

**Main Menu**

**Setup parameter reference screen**  
 See page 7.

**Teaching menu**  
 See page 9.

**Reference screen of other parameters**  
 See page 13.

**Output changes**

**Holding captured image**  
 Holds the image captured at the moment the output changes.  
 \*Cleared when another bank is selected.

**Changing the Screen Display Mode**

**"D" display**  
 Displays the real-time image.

**"2" display**  
 Displays the differentiated contour in the seven(7) levels of shading.

**"O" display**  
 Displays the judgment result of missings and stains.

Blue: Masking  
 Green: Object area of the missing checking (Yellow pixels indicate the missing edges)  
 Purple: Object area of stain (Red pixels indicate stains)

**Parameter Reference/Selection Screen**

**Parameter reference screen**

**Parameter selection screen**

Previous setting item / Next setting item / Returns to the Main menu / Set value +1 / Set value -1 / Cancels the selected values and returns to the parameter reference screen.

Locks the selected values. The locked values are displayed in blue and not changed. Press again to cancel the lock. (See page 14 "INITIALZ.")

**3 Settings (SETUP PARAMTR Menu)**

After installing the sensor and object, select the following settings to obtain the optimum contour (edge). After completing the settings, proceed with the teaching menu.

Function	Setting range (Initial value)	Description
Edge color filter	0 to 5 (1) COLORBL	Selects the colors with which the edge is generated. Set to eliminate unnecessary contour. 0: Differentiates all colors evenly. 1: Emphasizes the contour between B/W. 2: Differentiates the green elements. 3: Differentiates the blue and red elements. 4: Differentiates the red elements. 5: Differentiates the blue elements.
Light ON/OFF	0 to 3 (1) LIGHTON	Controls the internal and external lighting. You can set, for instance, the ultraviolet light to ON for the specified bank. 0: Internal light-OFF, External light-ON 1: Internal light-ON, External light-ON 2: Internal light-OFF, External light-OFF 3: Internal light-ON, External light-OFF
External light control signal	0, 1 (0) LIGHTOUT	0: Red/Black line is used for NG output. 1: Red/Black line turns off in synchronization with image capture. 2: Black line turns off in synchronization with image capture. Select "1" or "2" to control a commercial light source.
Shutter time	AUTO, 1 to 250 (100)** SHUTTER	Selects the shutter time (unit: 0.1 ms). Adjust it according to the object speed. SHUTTER value = 10 × Required line width (mm) ÷ Object speed (m/s)
Edge threshold value	AUTO, 1 to 255 (AUTO)** THRESHLD	Selects the threshold value to binarize the detected edge. In the process, search is performed for the values smaller than the set value by 4 to 24, and the optimum threshold value is applied.
Zoom	0, 1 (0) ZOOM	Selects the zoom setting of the image sensor. 0: Normal mode 1: Magnifies the center part to double size. Reduces the height and width of capture area by half.

\*The functions indicated in purple contain the set values for each bank.  
 \*\* Frequently adjusted parameters.  
 \*\* Appears "AUTO" when inputs smaller than "1". Possible to input under the optimum threshold automatically. Manual adjustment is however required in case the object was reflecting.

**4 Descriptions of Teaching Menu**

**Teaching Menu Screen**

**Outside of Judgment area (light blue)**  
 Select in **WINDOW SIZE**. It is not object area, but the position of captured image in this area is corrected.

**Masking area (blue)**  
 Select in **MASK EDITOR**. This area is ignored in judgment.

**Teaching menu**

**Teaching Menu Common Procedure**

Teaching menu Page 10

Returns the teaching results and returns to the teaching menu.

Locks the teaching results and returns to the teaching menu.

Window

PC communication  
 Data saving and loading with PC.  
 (PC software information: <http://www.optex-fa.com>)

**Teaching Procedure**

Main menu Page 5

Selects the capture area. Page 10  
 \*Cannot save the data when the capture area contains less than 16 x 16 pixels only.

Saves the captured image. Page 11

Select the judgment area. Page 11  
 \*Cannot save the data when the judgment area contains less than 32 pixels only.

Masking Page 12

PC communication

Returns to the Main menu

Locks the selected menu. The locked menu are displayed in blue and not changed. Press again to cancel the lock.

**Capture Area (VIEW AREA)**

Narrows the capture area when the object position is not properly corrected due to unnecessary background, contour, or when the shorter response time is required.

**Capture area vertical magnification/reduction**  
 UP/DOWN: Magnifies the window vertically. Reduces the window vertically.

**Capture area horizontal magnification/reduction**  
 LEFT/RIGHT: Magnifies the window horizontally. Reduces the window horizontally.

**Result saving**  
 UP/DOWN: Saves the result and exits. Cancels the result and exits.

**Saving the Reference Image (SAVE PATTERN)**

Set the reference image to be compared with the object image. It takes 6 to 7 seconds to save the image up to processing the contour information. (During processing, "SAVE PATTERN" turns red.) When selecting of the judgment area and the mask setting is completed, adjust the object position so that its contour fits in its settings.

**Judgment Area (WINDOW SIZE)**

Selects the size and position of the judgment area. Set the required minimum setting since a larger judgment area results in a longer response time.

**Judgment area Up/Down**  
 UP/DOWN: Moves up the window. Moves down the window.

**Judgment area Right/Left**  
 LEFT/RIGHT: Moves the window to right. Moves the window to left.

**Judgment area vertical magnification/reduction**  
 UP/DOWN: Magnifies the window vertically. Reduces the window vertically.

**Judgment area horizontal magnification/reduction**  
 LEFT/RIGHT: Magnifies the window horizontally. Reduces the window horizontally.

**Result saving**  
 UP/DOWN: Saves the result and exits. Cancels the result and exits.

**Masking**

Specifies the area to be ignored in the judgment area. You can create the shape by lapping over or cutting out the quadrangular windows.

**Window**  
 The mask is added/deleted in this red part.  
 \*The yellow bar is for guide.  
 The masked area is displayed in blue.

**Masking window Up/Down**  
 UP/DOWN: Moves up the window. Moves down the window.

**Masking window Right/Left**  
 LEFT/RIGHT: Moves the window to right. Moves the window to left.

**Masking window vertical magnification/reduction**  
 UP/DOWN: Magnifies the window vertically. Reduces the window vertically.

**Masking window horizontal magnification/reduction**  
 LEFT/RIGHT: Magnifies the window horizontally. Reduces the window horizontally.

**Mask add/delete with masking window**  
 UP/DOWN: Adds the inside of window. Deletes the inside of window.

**Mask add/delete outside masking window**  
 UP/DOWN: Adds the outside of window. Deletes the outside of window.

**Masking result saving**  
 UP/DOWN: Saves the result and exits. Cancels the result and exits.

**5 Settings (OTHER PARAMTR Menu)**

Parameters to adjust the missing edge/stain detection.  
 Adjust to shorten the response time or select the action for the object change.  
 Adjust the parameters indicated in blue to stabilize the detection.

Function	Setting range (Initial value)	Description
Bank selection	0 to 16 (16) BANK	Selects the bank selecting option. 0: 14: Selects the set bank. (Bank selection 2 input is the external teaching input) 15: Selects a bank by external input. (Bank selection 2 input is the external teaching input) 16: Selects a bank by external input. (Bank selection 2 input is available)
Copy of bank setting	0 to 14 (0) BANKCOPY	Copies the set values and masking display of the current bank to the destination bank. During copying, capture is interrupted. When the power is turned off, the setting returns to "0".
Background edge pixel threshold level	AUTO, 1 to 9999 (AUTO) BGDTHL	Selects the threshold level of the occupied pixels out of the saved reference edge (displayed in red). The value lower the setting is judged NG. Select "AUTO" to adjust optimum pixel automatically.
Background edge detection margin	AUTO, 1 to 14 (AUTO) BKGDMGN	Selects the area margin to be ignored near the saved reference contour. Select "AUTO" to adjust optimum width automatically.
Background edge detection sensitivity	0 to 7 (6) BKGDSNS	Set the edge threshold level of the stain detection area larger than that of the missing edge detection area, and select here smaller value so that unnecessary stain is not detected. Larger value will bring the display of threshold margin (page 4.) closer to arrow DOWN.

\*External teaching starts at rising of the bank selection 2 input signal.  
 \*Select the bank number by binary digit for bank selection input. (Example: Bank 10 = Bank 1 and 3 ON)

Function	Setting range (Initial value)	Description
Communication	0 to 5 (0) COMMUNIC	Selects Communication setting. 0: Off 1 to 5: On. Baud rates are 4800, 9600, 19200, 38400, 57600bps in order. Data length=8bit, no parity, stop bit=1. When the communication function is activated, external lighting and remote monitoring are deactivated.
Parameter initialization	0 to 15 (0) INITIALZ	Select "15": Press and hold <b>UP</b> and <b>DOWN</b> and turn the power on. Selected values and mask settings are all initialized. 10: Locks all the settings. 11: Cancels the lock status.
Missing pixel threshold level	AUTO, 1 to 9999 (AUTO) MISSTHLD	Selects the threshold level of the missing pixels (displayed in yellow) from the saved reference contour. The value over the setting is judged as NG. Select "AUTO" to adjust optimum pixel automatically.
Missing edge detection margin	AUTO, 1 to 8 (AUTO) MISGDMGN	Selects the contour width to set the captured contour in binarize. Increasing by "1" widens the contour to downward or right by 1 pixel so that slight position shift does not result in error detection. Select "AUTO" to adjust optimum width automatically. Selecting larger value is effective when search is not stable.
LCD up/down reverse	0, 1 (0) LCDVIEW	0: Normal display 1: Reverses the LCD display vertically. Select "1" when installing the unit upside-down.
OFF delay time	0 to 5000 (0) OFFDELAY	Delays turning OFF of the OK/NG output. Allows it to turn off when the judgment result remains in OFF condition continuously for over the selected delay time (unit: ms).
ON delay time	0 to 5000 (0) ONDELAY	Delays turning ON of the OK/NG output. Allows it to turn on when the judgment result remains in ON condition continuously for over the selected delay time (unit: ms).

Function	Setting range (Initial value)	Description
One shot/output holding	0, 1 (0) ONESHOT	Select "1" to keep the output ON for the off-delay time after the output turns on. When the off-delay time is set to "0", the output remains on. Change the bank to turn off the output.
Rolling correction margin	0 to 20 (0) ROLLING	Corrects the horizontal width variation of moving object caused by influence of the rolling shutter. Increase/reduce the value by "1" to change the width by approx. 0.8%, and search the optimum value. The expansion rate is ±15.6% at the maximum value "20". *The acceptable detect transfer direction is only right/left against the sensor front.
Magnification	0, 1 (0) MAGNIF	To magnify the correction value set at ROLLING of above. When the distance to workpiece would fluctuate, select "1".
Rotating angle fine adjustment	0 to 14 (0) ROTATE	Adjusts delicately the angle of captured image to search the optimum angle. Increase/decrease the value by "1" to rotate the image right/left by approx. 0.45 degrees. The angle is a 6.2 at the maximum value "14".
Position search range	0 to 25 (5) SEARCH	Selects the number of pixels to search the captured edge position so that the edge is aligned with the reference edge by median point. Search is performed up to four(4) times as large as the setting right/left, and up to the same number as the setting to up/down. Select larger value when position shifting of the object results in unstable position correction.
Position search mode	0, 1 (0) SEARCHMD	0: Starts searching from the point that position shifting is given at median point of the edge that appears in the view area. 1: Use this when to detect only dirt. In this case edge is not given. Position shifting is not given.

\* Calculate the object transformation ratio by rolling shutter using the following formula.  
 Transformation ratio (%) = Object speed (m/s) × Horizontal resolution × 5.65 / Horizontal capture area (mm)
